

# CPR0003319 - INT - Discount per Country

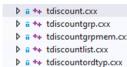

## CPR/Project Summary

- currently the discounts will be transferred from ZDP to KSC per branch, so in the overnight job up to 20 discount transfers running
- the data transferred is same exactly for each branch, meaning up to 20 time duplicated data in database and 20 times slower to transfer overnight.
- this should be changed to transfer the discounts per country in branch 0 and do all required change to use discount data only from branch 0
- this is related to an major incident from 01.07.2025, details can be provided by Frank Naumann

## CPR/Project Scope

### Phase I: Analysis of feasibility

- verify/update the loadconditions to handle the discount transfer to branch 0
- Check all database tables and source code modules involved in discount (add item/order close) in Csc\_core\_application::pxdb

expecting cscservice/pxverbund ..

- Check all batches involved in loading discount data and verify if they contain branch information
- Extract all discount use cases (add Item, and Order close)
- Analyse required change in detected modules/batches

### Phase II: Implement discount data in branch 0

- update all batches involved in discount data to use only branch 0
- update all detected module / sql requests to use branch 0
- Test all discount use cases to check for possible regression

### Phase III: remove completely branch information from discount data

- update all batches involved in discount data to remove branch information
- update all detected module / sql requests to remove branch information
- Test all discount uses cases to check for possible regresion
